

The EverFlow™ Air Dryer Module when used in an air dryer system is intended to remove moisture and other contaminants normally found in the air brake system. The air dryers are plumbed in parallel, splitting from a common compressor discharge line, then recombining to a common delivery line to the compressors.

The module monitors compressor charge time and when the charge time exceeds 30 seconds the module switches the drying load to the other air dryer in the system. The module continues to alternate between the dryers at 30 second intervals, allowing the unloaded dryer to purge while the other dries the incoming air.
